How the pictures were made

- **The public sites**, from the live sites on Wednesday November 11th 2026 at about 11.30am, in Chromium.
- **Sizes:** computer at 1440px wide; phone at 390px wide with touch. Very tall pages are cut into halves (one per page) or into strips shown side by side, read left to right.
- **Content:** pictures marked SAMPLE use content typed in for the picture (a running order, a week, a flowchart). Clockmaker's clock is its built-in Example. Pictures marked REAL show the sites' real figures at the time: Hindcaster's final update for Tuesday November 10th, Lightreader's and Nightreader's times for Caversham (RG4), Refueller's prices from the 10.15am collection, Riverwatcher's levels from the 11.10am update, and Roadteller's collision figures for 2021 to 2025.
- **Tenniserver and Motoracer** (private, behind a sign-in): built from their repos on Thursday November 12th 2026, with the real data saved there (Tenniserver's 10am update; Motoracer's of 5.50pm on November 11th).
- **Checks:** no page errors and no sideways scrolling on any picture, and the brand fonts loaded every time.
- **Light mode** throughout, apart from the dark-mode page and the private sites' dark looks.

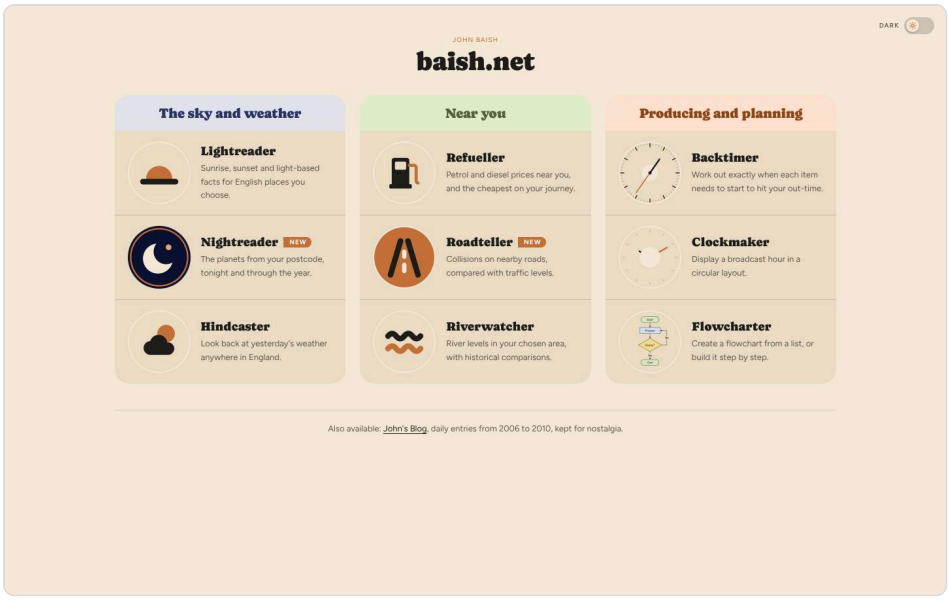

Fig 1. The hub on a computer (1440px), redesigned on November 11th: nine tools in three coloured panels, "The sky and weather", "Near you" and "Producing and planning", each with the drawing from its link-preview picture, NEW on the two newest, and John's blog in the footer.

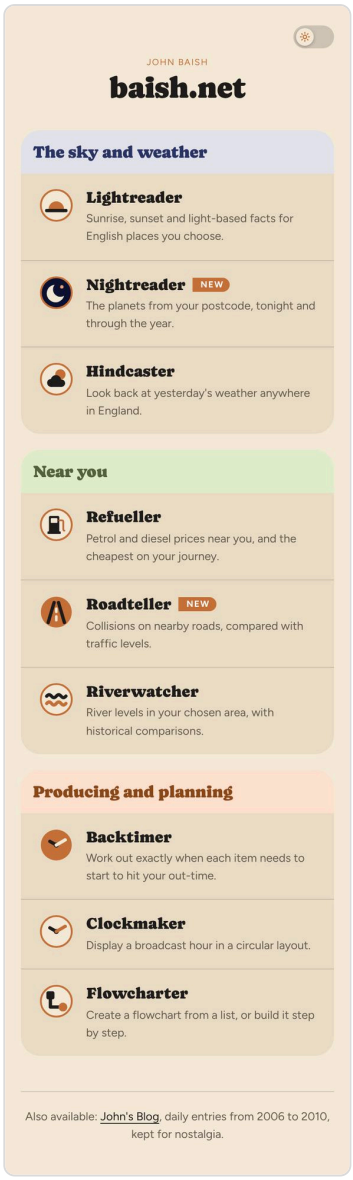

Fig 2. The hub on a phone (390px, full page): one column, small icons.

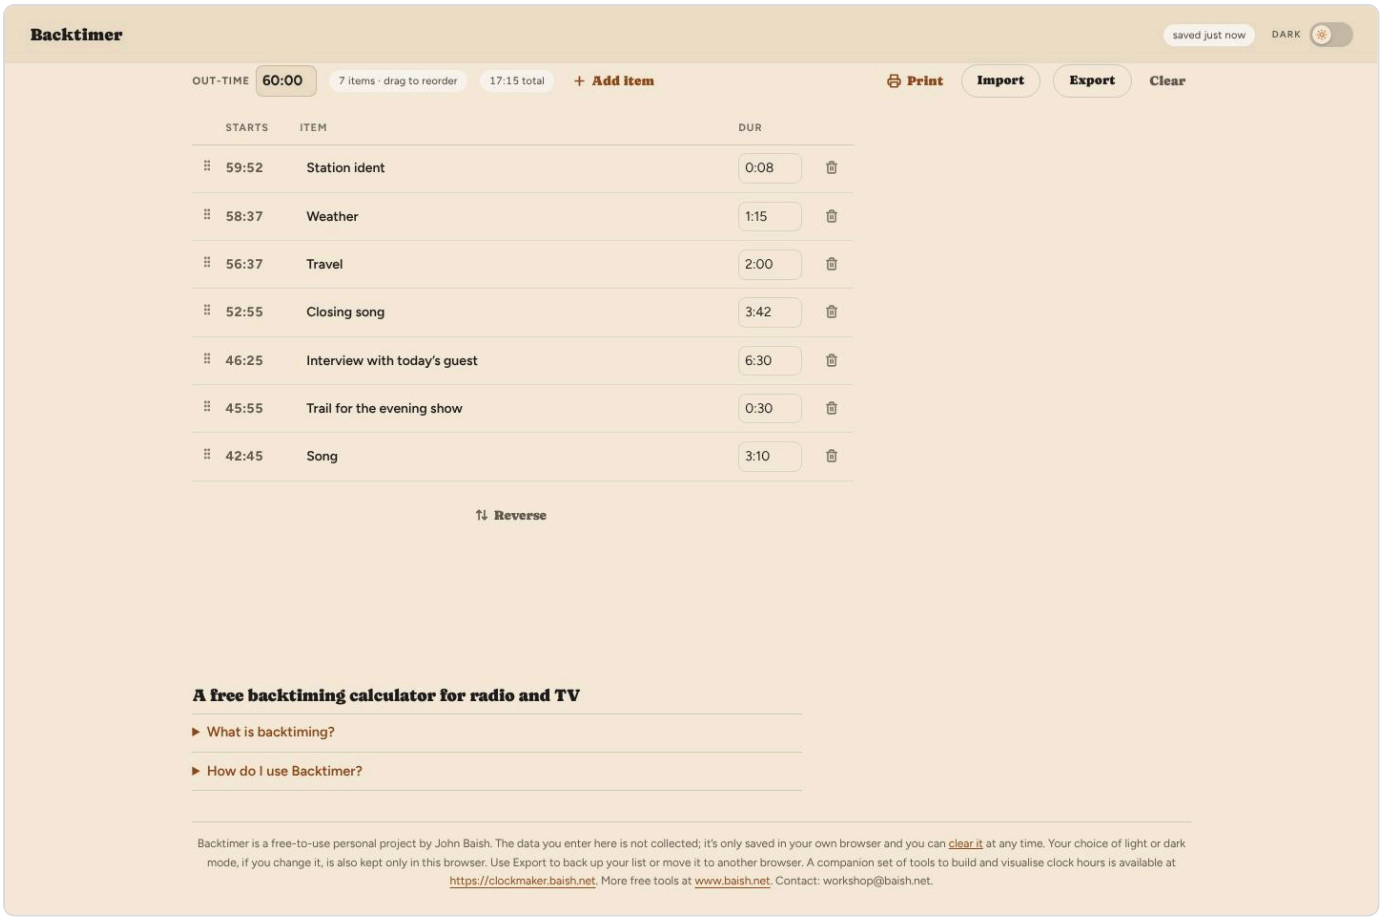

Fig 3. SAMPLE A running order to the news at 60:00 (1440px): seven items totalling 17:15, from "Station ident" (starts 59:52) back to "Song" (42:45).

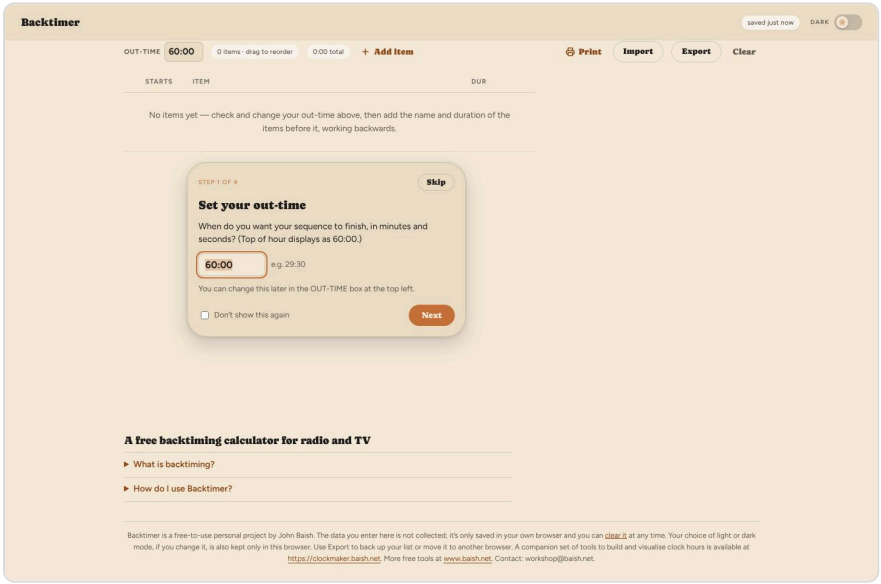

Fig 4. A first visit: the getting-started walkthrough, step 1 of 4, under the empty list.

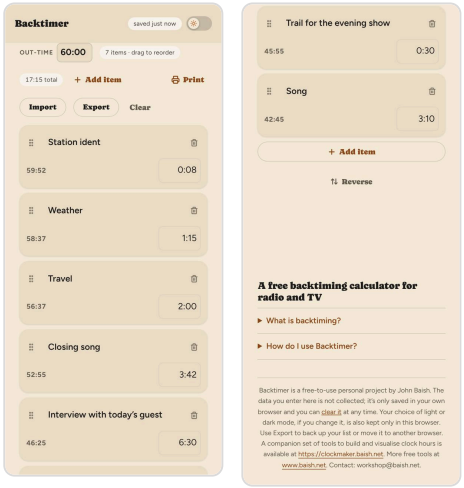

Fig 5. SAMPLE The running order on a phone (full page, two strips, read left to right).

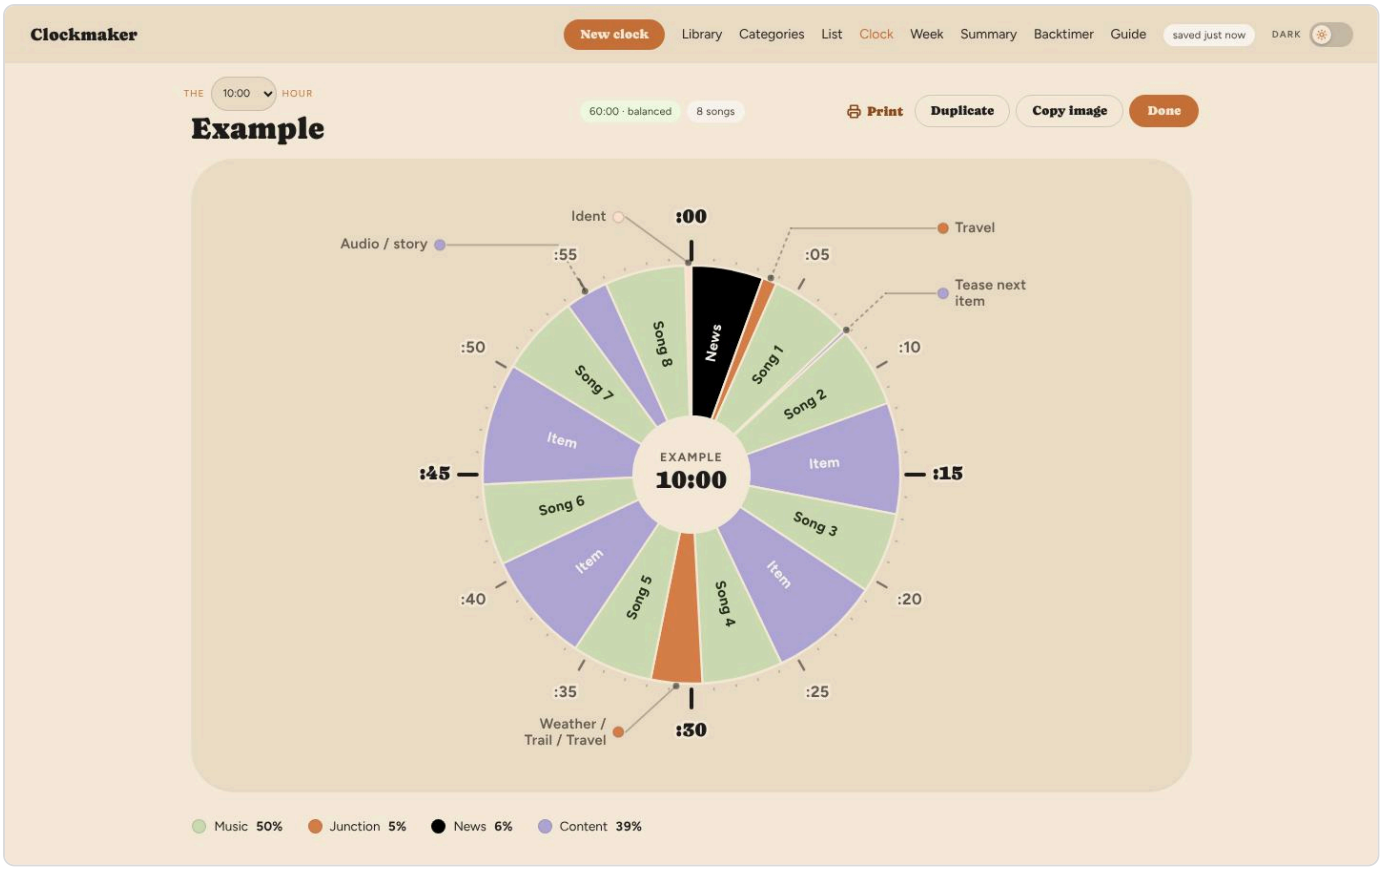

Fig 6. The Clock screen (1440px): the built-in Example clock for 10:00, 18 segments adding up to exactly 60:00 ("balanced", 8 songs), with callouts for the short items.

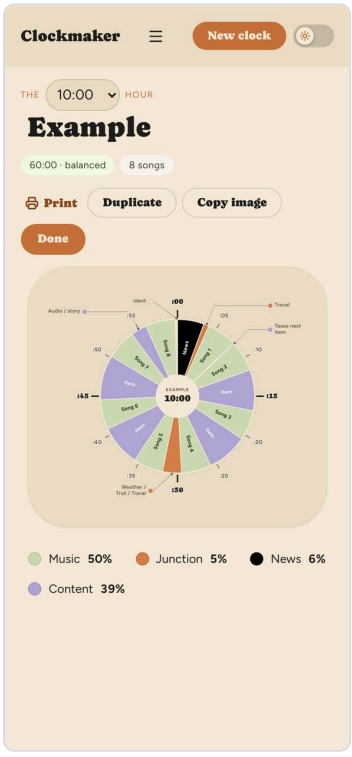

Fig 7. The same clock on a phone (first screen).

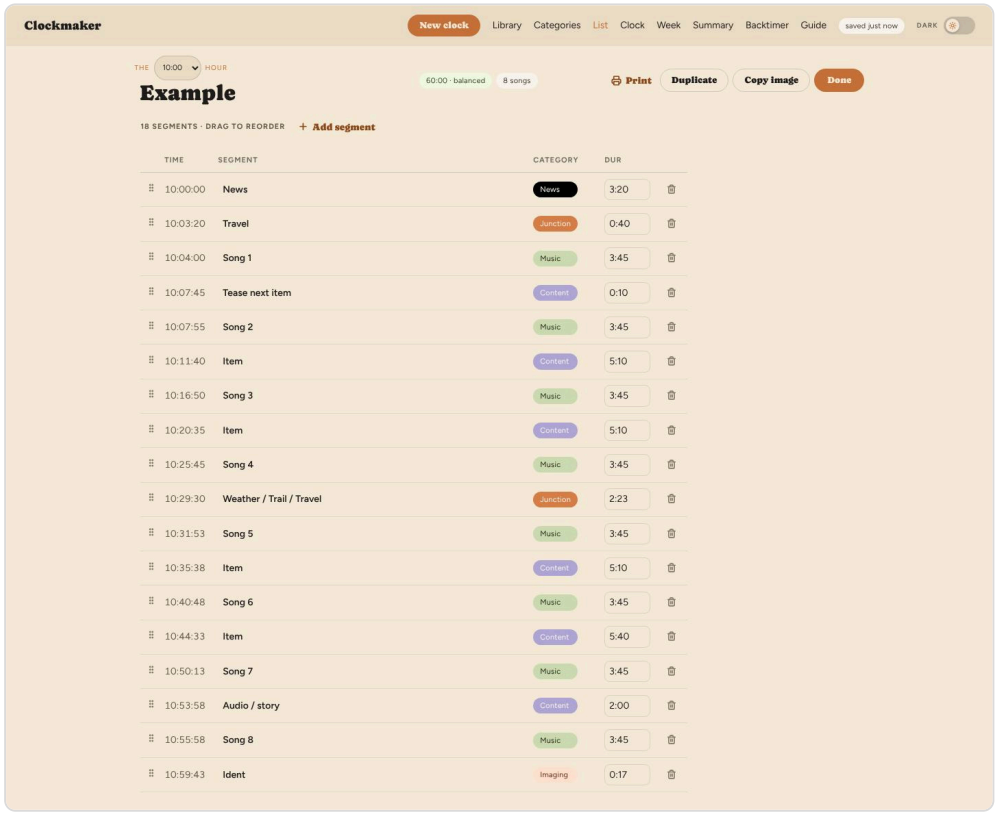

Fig 8. The Example clock as a List: times worked out from 10:00, category pills, durations in outlined boxes.

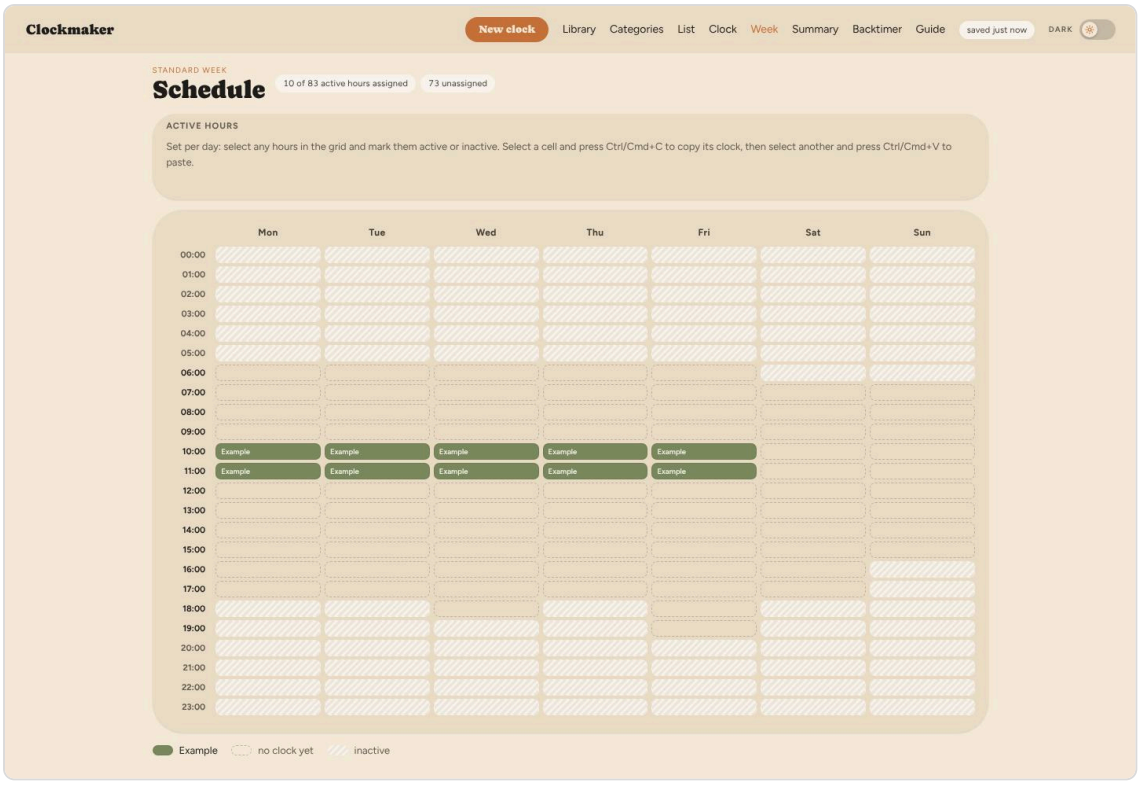

Fig 9. SAMPLE Week ("Schedule"), with the Example clock given to 10:00 and 11:00 on weekdays; hatched cells are inactive hours.

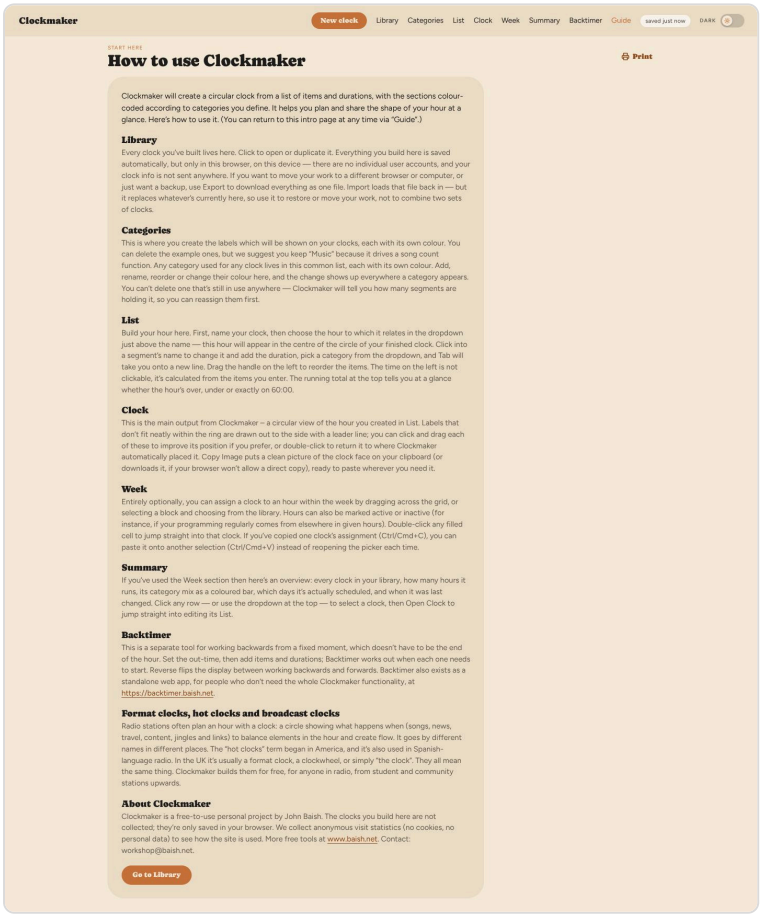

Fig 10. The Guide, shown on a first visit: John's own text, a section per screen, and "About Clockmaker".

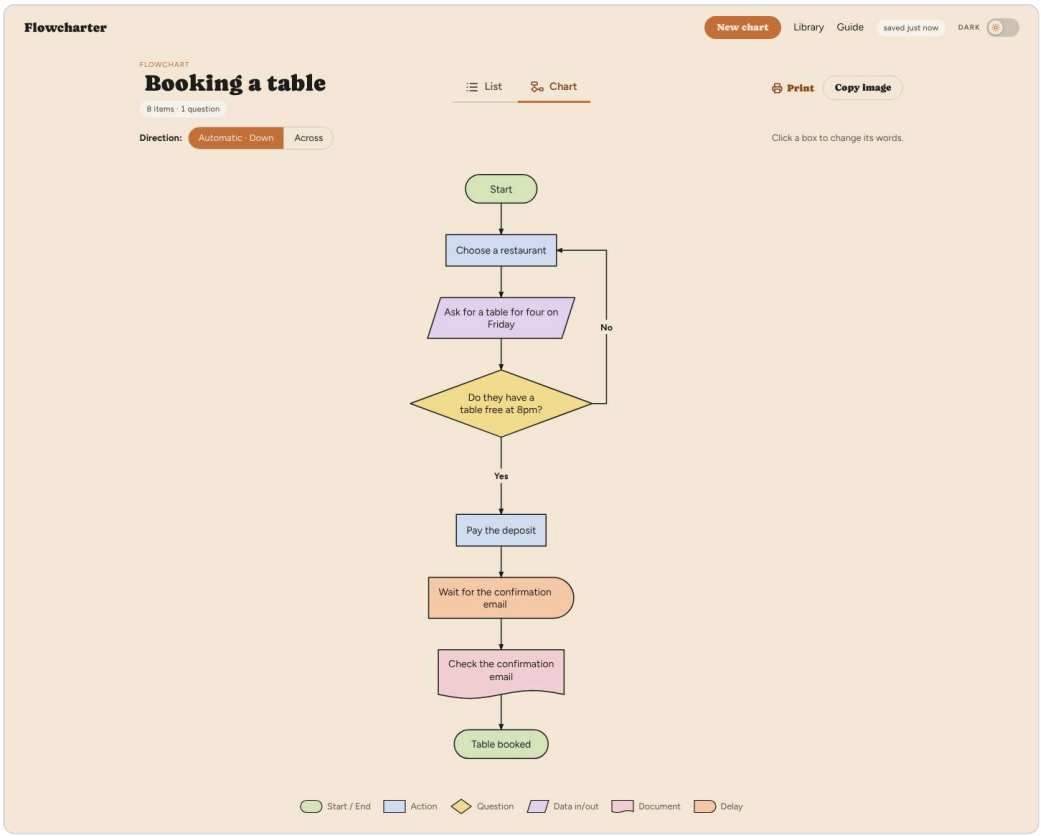

Fig 11. SAMPLE "Booking a table" drawn from an eight-row list (1440px). Automatic chose Down; the question's "No" loops back.

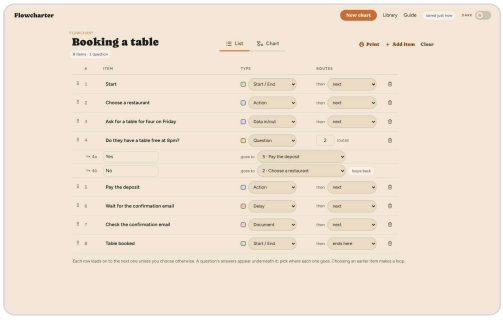

Fig 12. SAMPLE The list behind it: text, shape and where each row goes.

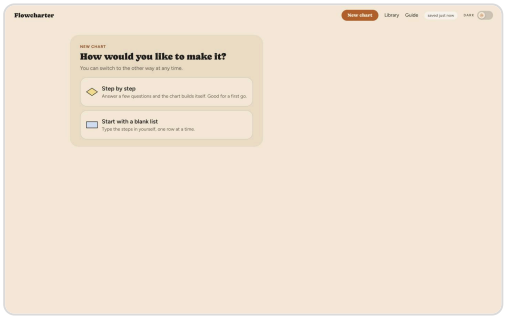

Fig 13. "New chart": step by step on cards, or a blank list.

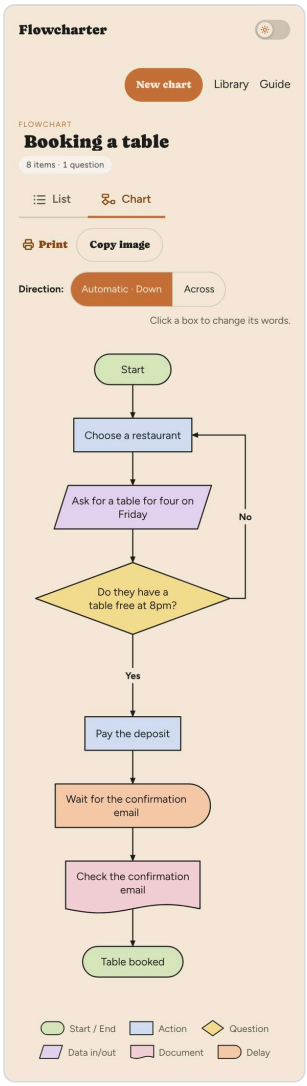

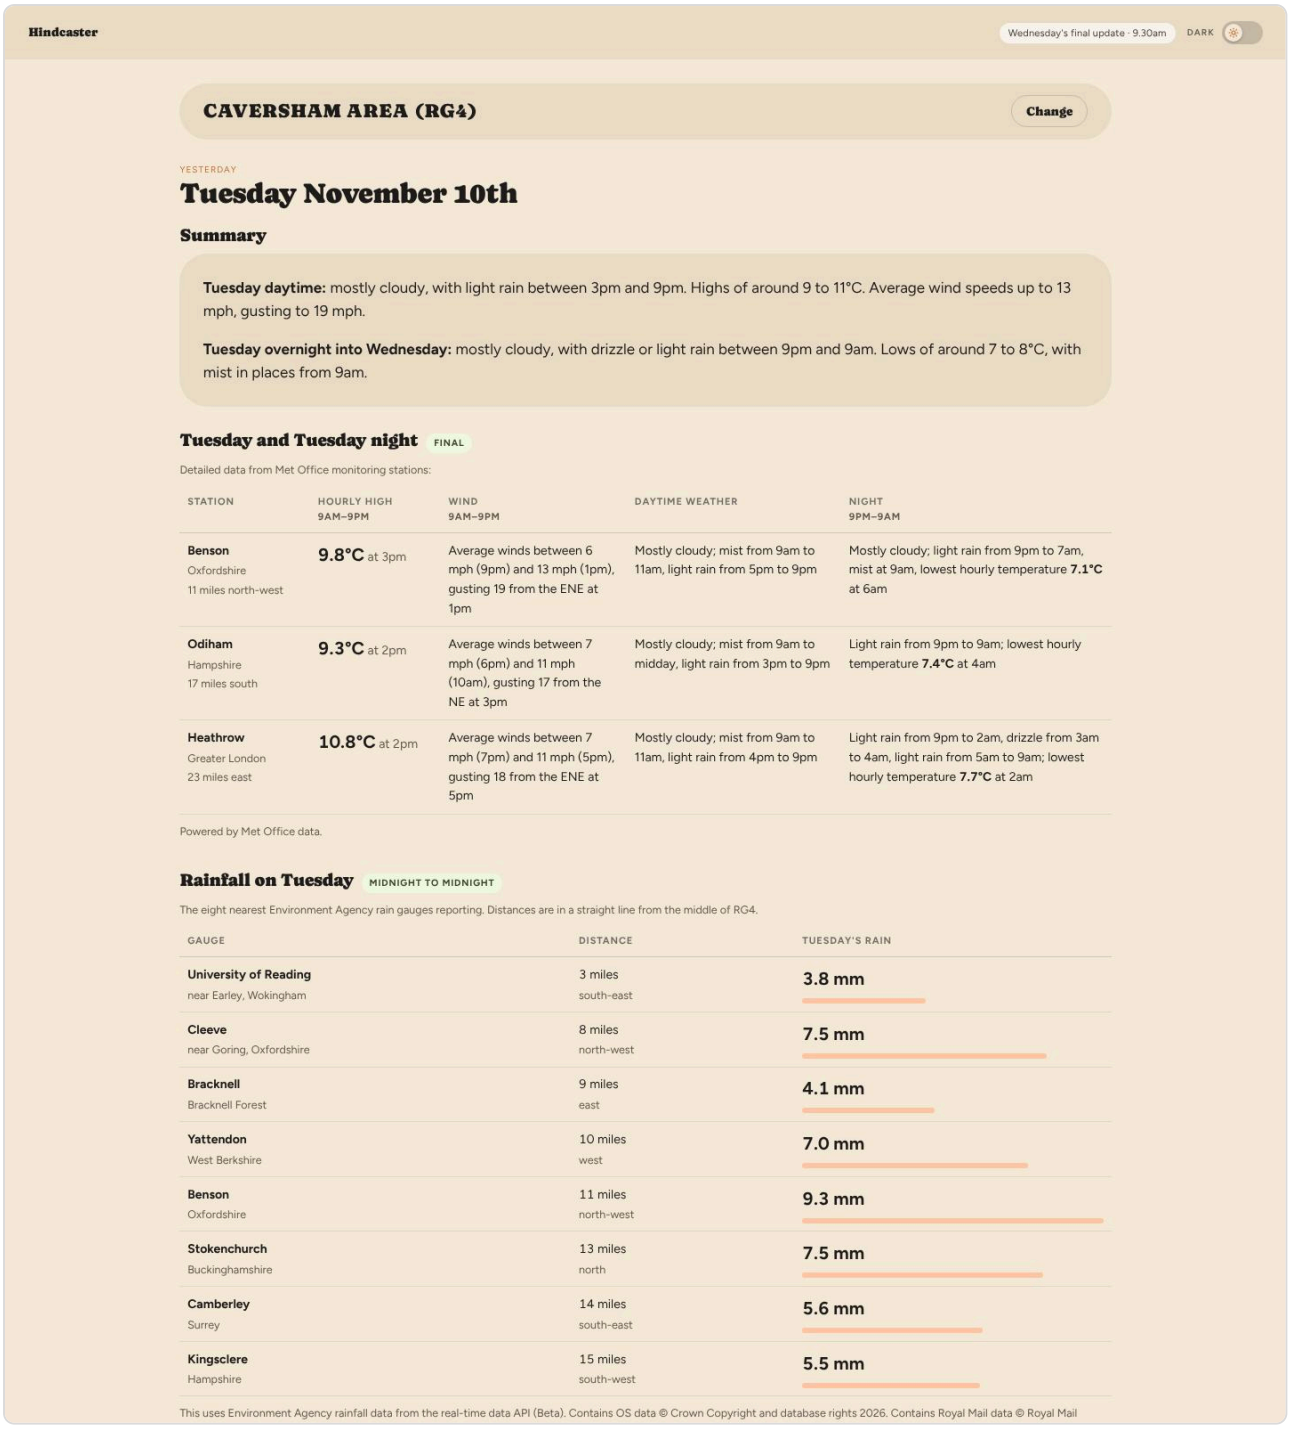

Fig 14. SAMPLE The chart on a phone (full page).

Wednesday's final update · 9.30am DARK

CAVERSHAM AREA (RG4) Change

YESTERDAY

Tuesday November 10th

Summary

Tuesday daytime: mostly cloudy, with light rain between 3pm and 9pm. Highs of around 9 to 11°C. Average wind speeds up to 13 mph, gusting to 19 mph.

Tuesday overnight into Wednesday: mostly cloudy, with drizzle or light rain between 9pm and 9am. Lows of around 7 to 8°C, with mist in places from 9am.

Tuesday and Tuesday night FINAL

Detailed data from Met Office monitoring stations:

STATION	HOURLY HIGH 9AM–9PM	WIND 9AM–9PM	DAYTIME WEATHER	NIGHT 9PM–9AM
Benson Oxfordshire 11 miles north-west	**9.8°C** at 3pm	Average winds between 6 mph (9pm) and 13 mph (1pm), gusting 19 from the ENE at 1pm	Mostly cloudy; mist from 9am to 11am, light rain from 5pm to 9pm	Mostly cloudy; light rain from 9pm to 7am, mist at 9am, lowest hourly temperature **7.1°C** at 6am
Odiham Hampshire 17 miles south	**9.3°C** at 2pm	Average winds between 7 mph (6pm) and 11 mph (10am), gusting 17 from the NE at 3pm	Mostly cloudy; mist from 9am to midday, light rain from 3pm to 9pm	Light rain from 9pm to 9am; lowest hourly temperature **7.4°C** at 4am
Heathrow Greater London 23 miles east	**10.8°C** at 2pm	Average winds between 7 mph (7pm) and 11 mph (5pm), gusting 18 from the ENE at 5pm	Mostly cloudy; mist from 9am to 11am, light rain from 4pm to 9pm	Light rain from 9pm to 2am, drizzle from 3am to 4am, light rain from 5am to 9am; lowest hourly temperature **7.7°C** at 2am

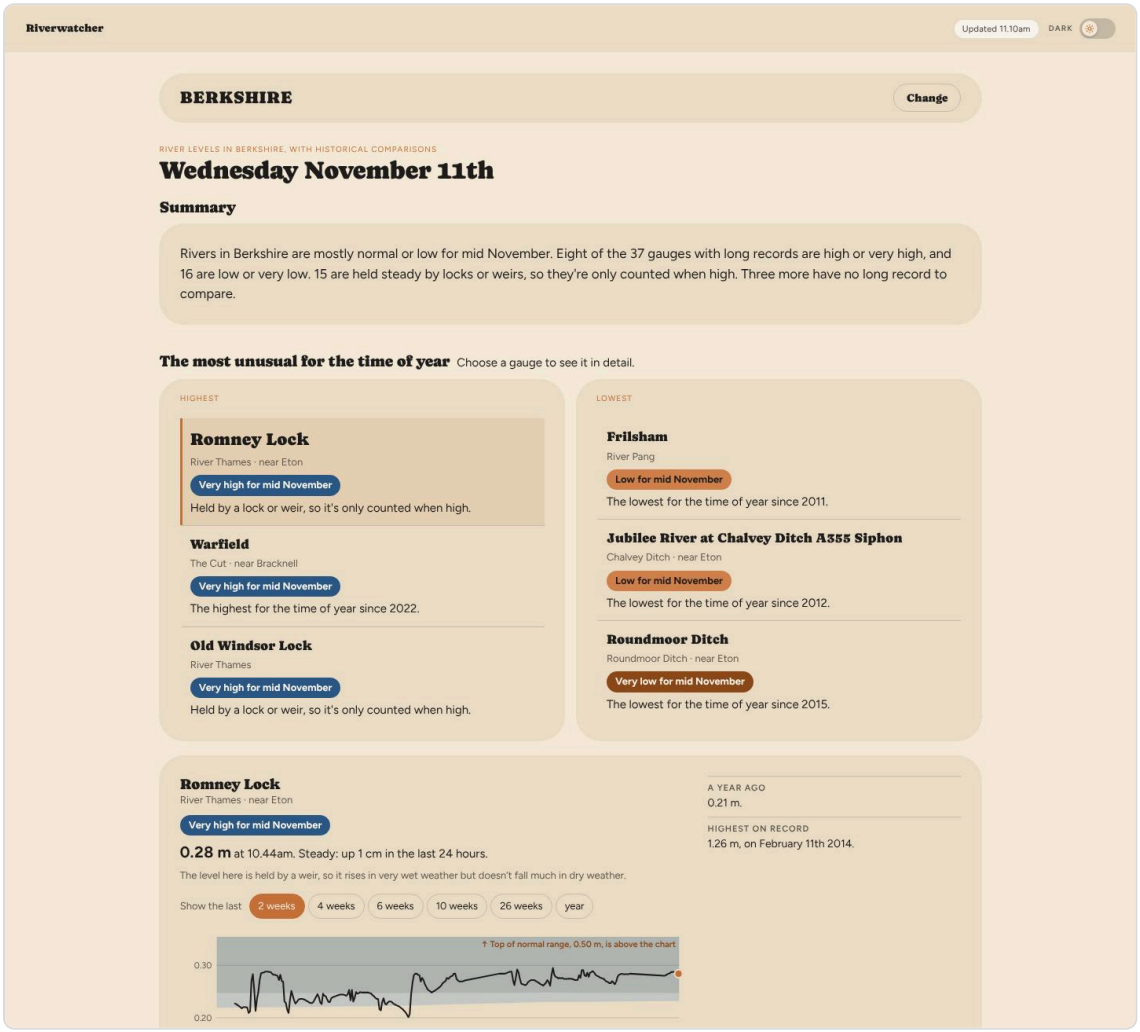

Fig 39. REAL Berkshire (1440px, top half): the summary, the most unusual gauges, and every gauge in the county folded away.

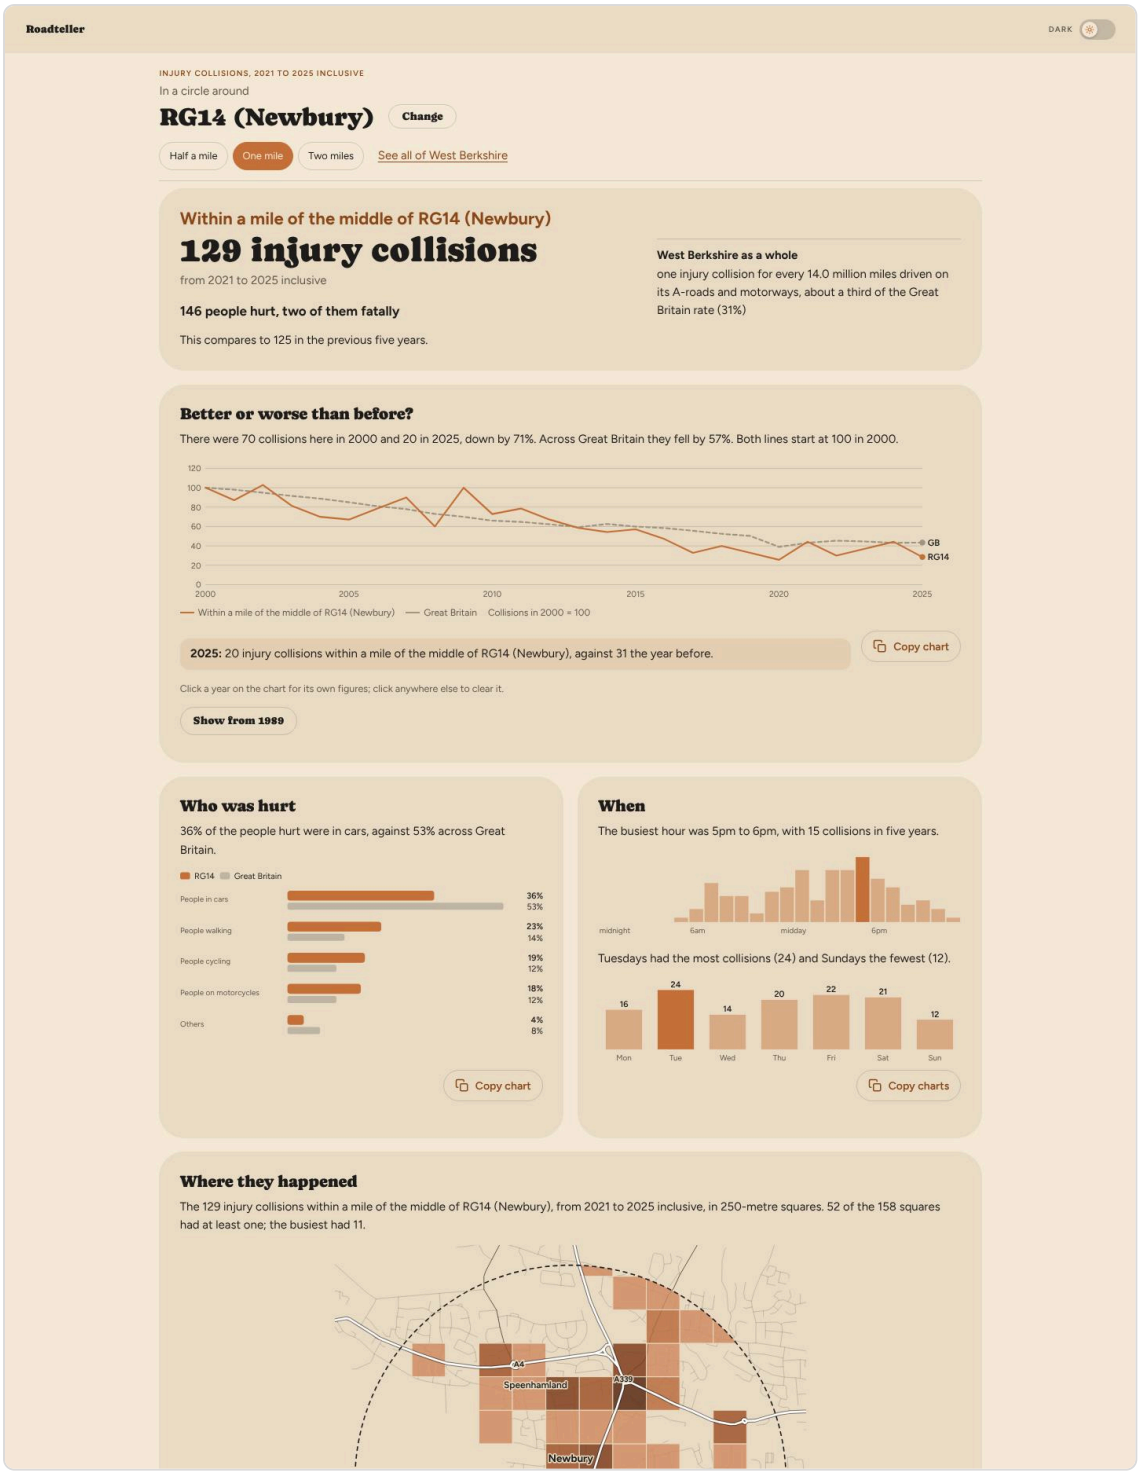

Fig 40. REAL A mile round the middle of RG14 (Newbury), injury collisions from 2021 to 2025 (1440px, top half): 129 collisions and 146 people hurt, beside West Berkshire's rate on its A-roads and motorways (one for every 14.0 million miles driven, about a third of Great Britain's); "Better or worse than before?" against Great Britain since 2000; who was hurt; and when.

Main roads through the circle

61 of the 129 collisions in the circle were on A-roads and 68 on minor roads. Of the stretches that pass through it, the A4 from A34/A4 Roundabout to Junction A4/A339 had the most collisions for its traffic: one for every 1.9 million miles driven, 71% higher than the rate for Great Britain's A-roads.

STRETCH	ONE FOR EVERY	AGAINST GREAT BRITAIN'S A-ROADS OR MOTORWAYS
A4 A34/A4 Roundabout to Junction A4/A339	1.9 million miles	71% higher than Great Britain's A-roads
A4 A339 intersection to Pipers Way, Thatcham	2.2 million miles	45% higher than Great Britain's A-roads
A343 Garden Close Lane to A339	3.0 million miles	About the same as Great Britain's A-roads (104%)
A339 A343 to A4 intersection	3.2 million miles	About the same as Great Britain's A-roads (100%)
A339 Pinchington Lane to A343	Too few to say	
A339 A4 intersection to A34	Too few to say	

Traffic is counted between junctions, so some collisions are included which are outside the one-mile circle. Collisions at a junction between two stretches count half to each.

About these figures

Roadteller counts collisions on public roads which were reported to the police in which someone was injured, from the police records published by the Department for Transport. Collisions in which nobody was hurt aren't included, and some injuries are never reported to the police, so the true numbers are higher.

The main figures cover the last five complete years, 2021 to 2025, compared with the five years before, 2016 to 2020. The earlier period includes the pandemic year of 2020 when there was much less traffic.

A circle counts every collision the police recorded within half a mile, a mile or two miles of the middle of the postcode or place. A council area counts every collision within its present boundaries, whichever council it was recorded under at the time.

"One injury collision for every 14.0 million miles" compares collisions on a council area's A-roads and motorways with the miles driven on them, from the Department for Transport's traffic figures. Minor roads aren't included, because data about traffic levels isn't available in the same way.

Traffic is measured stretch by stretch, between junctions. Only about a quarter of the yearly figures for A-roads and motorways come from a count on that road in that year; the rest are the Department for Transport's estimates, and about a third of stretches weren't counted at all from 2021 to 2025. The Department says figures for a single road or a small area are less reliable than those for a region or the whole country, so a road's figure is a guide rather than an exact measure.

Each collision on an A-road or motorway is matched to the nearest stretch of the same road, drawn along the real road from Ordnance Survey's map. A collision which happened within 60 metres of a junction counts half to each of the stretches either side, which affects about one in seven collisions on these roads across Great Britain.

At least 10 collisions are required to create a fair rate, otherwise none is shown.

"Allowing for the mix of roads" takes the Great Britain rates for motorways and A-roads and applies these to the proportion of these types of roads in the area, comparing the result with collisions. Motorways have far fewer collisions for their traffic than other roads, so an area with a lot of motorway looks better than it otherwise would do.

"Better or worse than before?" goes back to 2000 for rates. For a circle, counts go back to 1989. Before then, the locations of too many collisions can't be placed on a map. Older locations are also rougher, often to the nearest 100 metres, so a collision near the edge of a circle may fall just inside or just outside it.

"Serious or fatal" is as the police recorded it. Some police forces have changed the way they record injuries over time, with a lower threshold for "serious", so changes over time or differences between areas can partly reflect the way they were recorded.

The map's squares count collisions, they don't allow for traffic. Busy roads have more collisions because more people use them, so a busy junction shows darker even where it is no more dangerous than a quiet lane.

Roadteller shows totals only, without details about individual collisions. It counts what was reported and, where traffic figures allow, makes fair comparisons with other areas. It deliberately does not attempt to label any road or place as "dangerous" or "safe". A higher figure can have many causes.
